### RESEARCH INTEREST

- Studies of the reactivity of organic substrates with metalloenzymes or biomimetic catalysts using quantum chemistry, electronic structure and spectra, quantum mechanics/ molecular mechanics.
- Simulations of intermolecular interactions in mesogens and biological molecules

### SUMMARY

- Successfully resolved a controversy that was arisen from different sets of experiments by two research groups on the mechanism of C-H hydroxylation by cytochrome P450 enzymes. Recently, Rittle and Green (Science (2010) 330, 933) characterized the compound I of P450 and found that it perform C-H hydroxylation via rebound mechanism as explained by theory since 2002.
- Explained the role of environment in catalytic reactions of P450 such electric field, water molecule etc.
- Described the oxidation properties of several non-heme enzymes/ systems such as Bleomycin, Cystein Dioxygenase, N4py, Bntpen etc.
- Characterized and suggested several potent oxidants of Polyoxometalate.
- Suggested correlations between physical properties like ionization potential, bond dissociation energies of drug like molecules with reaction barrier of reactions involved in drug metabolism by cytochrome P450 enzymes.
